D1: US 4937148 A (26 Jun. 1990)

1. Novelty

Claims 1-9 of the present invention are considered to be novel considering the available prior art, because none of cited prior art describes the technical elements and their structural relationships as specifically set out in the claims of the invention.

2. Inventive step

The subject matter of claims 1-9 of the present invention relates to a composition for coating an organic electrode and a method of manufacturing an organic electrode having high transparency using the said composition.

The primary elements to accomplish the object of the present invention consist of: polyvalence alcohol, polyol or their compound; a mixed solvent with amide and sulfoxide type or their surface active agent; a polyethylenedioxythiophene type conductive high polymer aqueous solution. The permeability of a coated organic conductive membrane into a visible ray area is over 90% and surface resistance of the membrane is 300-900 Ω /sq

The cited prior art, D1 provides a process for preparing conductive particles having a specific surface area of less than 50 m²/g which comprises hydrolyzing a hydrolyzable tin. A characteristic technical feature of the cited invention is the process for preparing conductive fine particles, conductive coating materials containing said conductive fine particles, and substrates having thereon transparent conductive coatings formed from said conductive coating materials.
